

### GENERAL DESCRIPTION

The SGM72204A is a single-pole/four-throw (SP4T) antenna tuning switch. The device features low on-resistance and turn-off capacitance, high linearity, low insertion loss and high RF voltage handling capability, which has a very significant improvement effect on TRP and TIS.

The SGM72204A is a GPIO interface product based on SOI process, allowing customers to flexibly use its control interface to improve product performance.

No external DC blocking capacitors required on the RF paths as long as no external DC voltage is applied, which can save PCB area and cost.

The SGM72204A is available in a Green UTQFN-1.1×1.5-10L package.

**OVERSTRESS CAUTION**

Stresses beyond those listed in Absolute Maximum Ratings may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect reliability. Functional operation of the device at any conditions beyond those indicated in the Recommended Operating Conditions section is not implied.

**ESD SENSITIVITY CAUTION**

This integrated circuit can be damaged if ESD protections are not considered carefully. SGMICRO recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage. ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because even small parametric changes could cause the device not to meet the published specifications.
