

## GENERAL DESCRIPTION

The SGM25662 is a small single channel load switch with ultra-low  $R_{ON}$ . The switch controlled by the ON pin operates from 2.5V to 5.5V supply voltage. It can be used in processor rails where voltage dropout is tightly required.

The device is designed with soft-start circuit to cope with inrush currents when large capacitive loads are connected.

The device integrates a 198Ω pull-down resistor for output discharge when the switch is shut down by ON to reduce the total solution size.

The SGM25662 is available in a Green TDFN-3x3-8EL package.

## FEATURES

- Single Channel Load Switch
- VIN Voltage Range: 0.8V to 5.5V
- Bias Voltage Range: 2.5V to 5.5V
- Ultra-Low On-Resistance:  
 $R_{ON} = 4.3\text{m}\Omega$  at  $V_{IN} = 5\text{V}$  ( $V_{BIAS} = 5\text{V}$ )
- 10A Maximum Continuous Switch Current
- VBIAS Quiescent Current: 12.0μA for  $V_{BIAS} = 5\text{V}$
- VBIAS Shutdown Current: 1.1μA for  $V_{BIAS} = 5\text{V}$
- Low Threshold 1.2V or Higher GPIO
- Rise Time: 2350μs at  $V_{IN} = 5\text{V}$  ( $V_{BIAS} = 5\text{V}$ )
- Quick Output Discharge (QOD)
- Available in a Green TDFN-3x3-8EL Package

## APPLICATIONS

Servers  
 Medical  
 Telecom Systems  
 Computing  
 Industrial Systems  
 High Current Voltage Rails

## TYPICAL APPLICATION

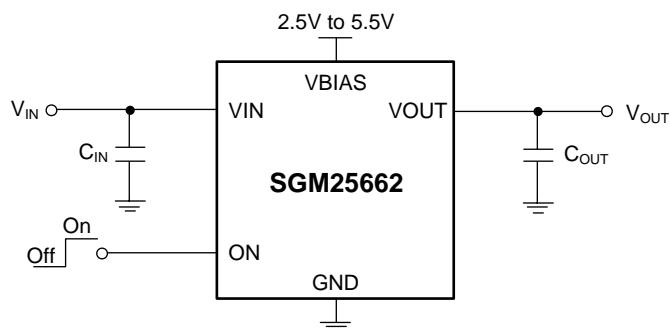

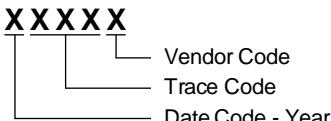

Figure 1. Typical Application Circuit

**PACKAGE/ORDERING INFORMATION**

MODEL	PACKAGE DESCRIPTION	SPECIFIED TEMPERATURE RANGE	ORDERING NUMBER	PACKAGE MARKING	PACKING OPTION
SGM25662	TDFN-3x3-8EL	-40°C to +105°C	SGM25662GTGB8G/TR	SGM 0MXGB XXXXX	Tape and Reel, 4000

**MARKING INFORMATION**

NOTE: XXXXX = Date Code, Trace Code and Vendor Code.

Green (RoHS & HSF): SG Micro Corp defines "Green" to mean Pb-Free (RoHS compatible) and free of halogen substances. If you have additional comments or questions, please contact your SGMICRO representative directly.

**ABSOLUTE MAXIMUM RATINGS**

Input Voltage Range, $V_{IN}$ .....	-0.3V to 6V
Bias Voltage Range, $V_{BIAS}$ .....	-0.3V to 6V
Output Voltage Range, $V_{OUT}$ .....	-0.3V to 6V
ON Pin Voltage Range, $V_{ON}$ .....	-0.3V to 6V
Maximum Continuous Switch Current, $I_{MAX}, T_A = +70^\circ C$ .....	10A
Maximum Pulsed Switch Current, Pulse < 300μs, 2% Duty Cycle, $I_{PLS}$ .....	12A
Package Thermal Resistance	
TDFN-3x3-8EL, $\theta_{JA}$ .....	51.5°C/W
TDFN-3x3-8EL, $\theta_{JB}$ .....	22.4°C/W
TDFN-3x3-8EL, $\theta_{JC}$ (TOP).....	44.6°C/W
TDFN-3x3-8EL, $\theta_{JC}$ (BOT) .....	17.5°C/W
Junction Temperature .....	+150°C
Storage Temperature Range.....	-65°C to +150°C
Lead Temperature (Soldering, 10s) .....	+260°C
ESD Susceptibility	
HBM.....	2000V
CDM .....	1000V

**RECOMMENDED OPERATING CONDITIONS**

Input Voltage Range, $V_{IN}$ .....	0.8V to $V_{BIAS}$
Bias Voltage Range, $V_{BIAS}$ .....	2.5V to 5.5V
ON Pin Voltage Range, $V_{ON}$ .....	0V to 5.5V
Output Voltage Range, $V_{OUT}$ .....	$V_{IN}$
Input Capacitor, $C_{IN}$ .....	> 1μF
ON Pin Input High Voltage, $V_{IH}$ .....	1.2V to 5.5V
ON Pin Input Low Voltage, $V_{IL}$ .....	0V to 0.5V
Operating Junction Temperature Range.....	-40°C to +125°C
Operating Ambient Temperature Range.....	-40°C to +105°C

**OVERSTRESS CAUTION**

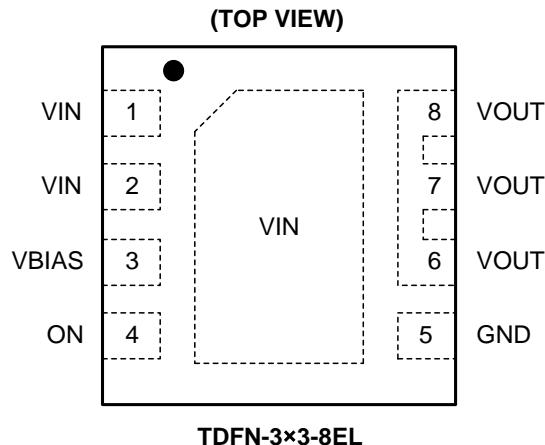

Stresses beyond those listed in Absolute Maximum Ratings may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect reliability. Functional operation of the device at any conditions beyond those indicated in the Recommended Operating Conditions section is not implied.

**ESD SENSITIVITY CAUTION**

This integrated circuit can be damaged if ESD protections are not considered carefully. SGMICRO recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage. ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because even small parametric changes could cause the device not to meet the published specifications.

**DISCLAIMER**

SG Micro Corp reserves the right to make any change in circuit design, or specifications without prior notice.

**PIN CONFIGURATION****PIN DESCRIPTION**

PIN	NAME	FUNCTION
1, 2	VIN	Switch Input Voltage Pin.
3	VBIAS	Power Supply Input for the Device.
4	ON	Enable Input. Logic high sets the device active, and logic low disables it and turns it into shutdown mode. Do not leave this pin floating.
5	GND	Ground.
6, 7, 8	VOUT	Output Voltage.
Exposed Pad	VIN	Switch Input Voltage.

SGM25662

## ELECTRICAL CHARACTERISTICS

( $V_{BIAS} = 5V$ ,  $T_A = -40^\circ C$  to  $+105^\circ C$ , typical values are at  $T_A = +25^\circ C$ , unless otherwise noted.)

## TYPICAL PERFORMANCE CHARACTERISTICS (continued)

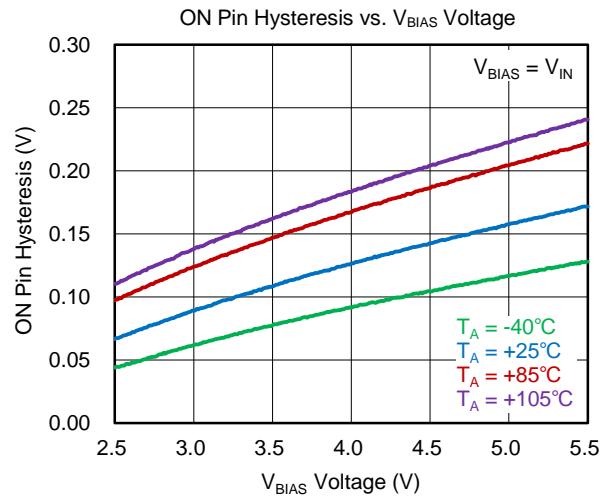

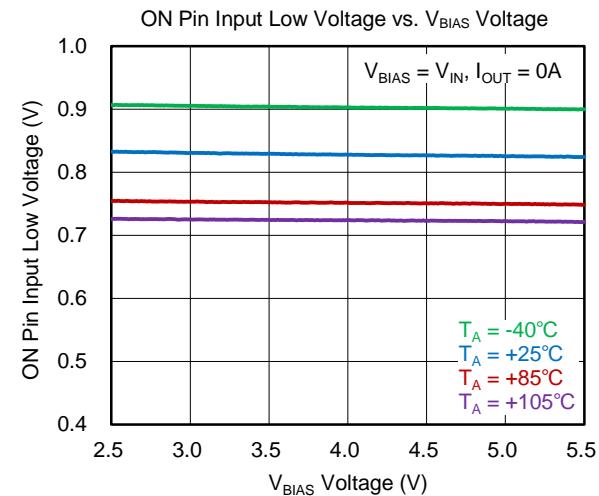

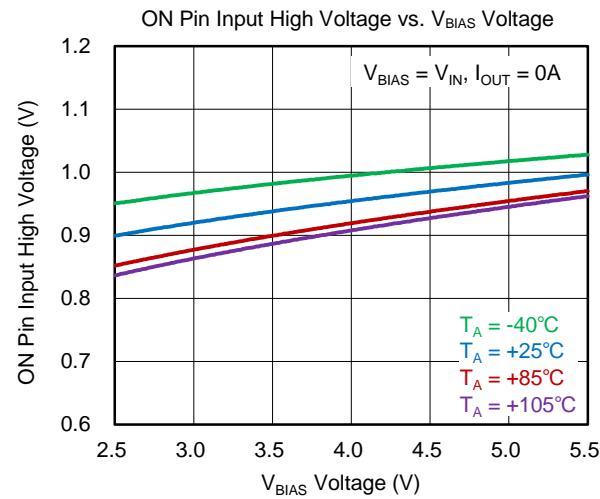

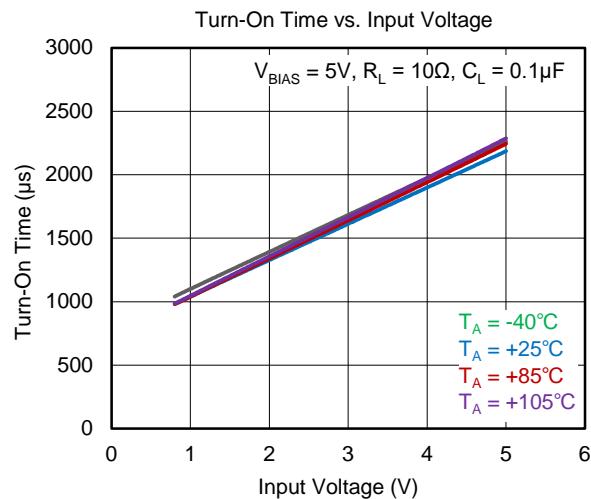

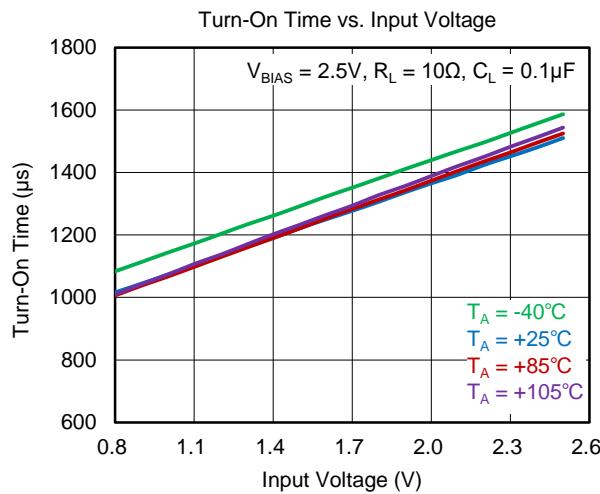

## TYPICAL PERFORMANCE CHARACTERISTICS (continued)

## DETAILED DESCRIPTION

### Input and Output

VIN should be connected to the power source that is the power supply of the loads and the internal logic circuit is provided by VBIAS. Normally, load current flows from VIN to VOUT.

### Supply Filter Capacitor

It is recommended to use a 10µF capacitor between VIN and GND close to the device pins. It can limit the voltage drop of the input supply. Larger  $C_{IN}$  can reduce voltage dip in high current applications. Without an input capacitor, short-circuit at the output will cause the input voltage to ring, which may destroy the chip's internal circuitry when the input transient voltage exceeds the absolute maximum supply voltage.

### Output Filter Capacitor

To reduce EMI, improve the transient performance, and minimize negative effects of resistance and inductance between the bypass capacitor and the downstream connector, a low-ESR 10µF ceramic capacitor between VOUT and GND is recommended as a standard bypass method. If the output port is connected to the load through a long cable, the parasitic inductance of the cable may cause voltage to ring, whose negative ringing may damage the chip, so an anti-parallel Schottky diode such as BAT54 is recommended to connect in parallel with the output.

### $V_{BIAS}$ Voltage Range

When  $V_{IN} < V_{BIAS}$ , the device gets the best  $R_{ON}$  performance. If  $V_{IN} > V_{BIAS}$ , the device will show a larger  $R_{ON}$  than the value in the electrical characteristics table even though it still work. Ensure that  $V_{IN}$  and  $V_{BIAS}$  are set to appropriate values, otherwise performance will not be guaranteed.

### Soft-Start

The soft-start feature is used to limit inrush current during start-up or hot-plug events so that the device can cope with inrush current when connected to large capacitive loads.

### Output Discharge

The SGM25662 integrates the output discharge feature. When the ON pin is pulled low, a discharge resistance with a typical value of 198Ω is connected between the VOUT and GND. This resistance pulls down the output and prevents it from floating when the device is disabled.

## APPLICATION INFORMATION

### Power Dissipation

Assuming a given ambient temperature and an output current, the maximum allowable power dissipation is calculated by:

$$P_{D(MAX)} = \frac{T_{J(MAX)} - T_A}{R_{θJA}} \quad (1)$$

where  $P_{D(MAX)}$  is the maximum power dissipation.  $T_{J(MAX)}$  is the maximum operating junction temperature.  $T_A$  is the operating ambient temperature.  $θ_{JA}$  is junction to air thermal impedance.

Please note that the thermal vias are placed under the exposed pad of the device, thus allowing for thermal dissipation away from the device.

### Inrush Current

The inrush current can be caused by the output capacitor. Use Equation 2 to estimate the inrush current.

$$I_{INRUSH} = C_{OUT} \times \frac{dV_{OUT}}{dt} \quad (2)$$

where  $I_{INRUSH}$  is the value of inrush current caused by  $C_{OUT}$ .  $C_{OUT}$  is the output capacitance value.  $dV_{OUT}$  is the rising change value of  $V_{OUT}$  after the device is enabled.

$dt$  is the time taken by the device to increase  $V_{OUT}$  after the device is enabled.

Select the appropriate  $C_{OUT}$  to ensure the stable operation of the device.

### PCB Layout Guidelines

A reasonable PCB layout is critical to the stable performance of the SGM25662. For best results, follow the guidelines below.

- Keep the power traces as short and wide as possible, and use at least 2 ounces of copper.
- Placing a ground plane under all circuits to reduce resistance and inductance will improve DC and transient performances.
- Ensure that the input decoupling capacitors on VIN have a minimal trace length to VIN and GND.
- Place the output capacitors as close to the SGM25662 as possible to minimize the effect of PCB parasitic inductance.
- The VBIAS pin requires a ceramic capacitor with low ESR for bypass. The recommended bypass capacitor is 0.1μF with X5R or X7R dielectric.
