

### GENERAL DESCRIPTION

The 74LVC1G126 is a single buffer/line driver with a non-inverting 3-state output and it is designed for 1.65V to 5.5V  $V_{CC}$  operation. The 3-state output is controlled by the output enable input (OE). When OE is low, the output is in the high-impedance state. When OE is high, the device passes data from the A input to the Y output. The device implements the Boolean function  $Y = A$ .

This device is highly suitable for partial power-down applications by using power-off leakage current ( $I_{OFF}$ ) circuit. When the device is powered down, the output is disabled, and the current backflow can be prevented from passing through the device.

The 74LVC1G126 is available in Green SC70-5 and SOT-23-5 packages. It operates over an ambient temperature range of  $-40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$ .

## OVERSTRESS CAUTION

1. Stresses beyond those listed in Absolute Maximum Ratings may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect reliability. Functional operation of the device at any conditions beyond those indicated in the Recommended Operating Conditions section is not implied.
2. The input and output voltage ratings may be exceeded if the input and output clamp current ratings are observed.
3. The performance capability of a high-performance integrated circuit in conjunction with its thermal environment can create junction temperatures which are detrimental to reliability.

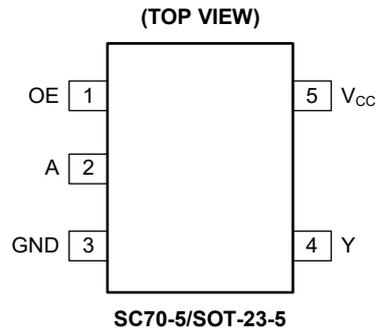

## ESD SENSITIVITY CAUTION

This integrated circuit can be damaged if ESD protections are not considered carefully. SGMICRO recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage. ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because even small parametric changes could cause the device not to meet the published specifications.
