

GENERAL DESCRIPTION

The SGM3842A is designed for powering AMOLED displays which requires V_{ELVDD} , V_{ELVSS} , V_{AVDD} and V_{DVDD} . The device integrates two Boost converters, VO1 for V_{ELVDD} and VO3 for V_{AVDD} , a dual-phase inverting Buck-Boost converter VO2 for V_{ELVSS} and a Buck converter VO4 for V_{DVDD} . Output voltages of all the four converters can be programmed in digital steps through the digital interface control pins (SWIRE1 & SWIRE2).

The SGM3842A is available in a Green WLCSP-2.5×2.9-42B package.

FEATURES

- 2.9V to 4.8V Input Supply Voltage Range
- Synchronous Boost Converter (ELVDD)
 - ◆ 4.6V to 5.2V Output Voltage with 100mV Steps
 - ◆ 4.6V Default Output Voltage
 - ◆ 0.8% Accuracy at 4.6V
 - ◆ 1A Output Current Capability
 - ◆ Output Voltage Sensing Pin for Path Loss Compensation (FB1)
- Synchronous Inverting Buck-Boost Converter (ELVSS)
 - ◆ -10V to -1.4V Output Voltage with 100mV Steps
 - ◆ -5.0V Default Output Voltage

- ◆ 1% Accuracy at -5V
- ◆ 1A Output Current Capability at -5.4V
- ◆ 660mA Output Current Capability at -9V
- Synchronous Boost Converter (AVDD)
 - ◆ 5.5V to 8.0V Output Voltage with 100mV Steps
 - ◆ 7.0V Default Output Voltage
 - ◆ 0.7% Accuracy at 7.0V
 - ◆ 150mA Output Current Capability
- Synchronous Buck Converter (DVDD)
 - ◆ 0.8V to 1.5V Output Voltage with 25mV Steps
 - ◆ 1.2V Default Output Voltage
 - ◆ 1.1% Accuracy at 1.2V
 - ◆ 300mA Output Current Capability
- V_{IN} and V_{OUT} Bi-Directional Isolation
- Short Circuit Protection (SCP)
- Overload Protection
- Thermal Shutdown
- V_{ELVSS} Start-Up Delay: 6ms
- Short Circuit and OLP Detection Time: 1.2ms
- Available in a Green WLCSP-2.5×2.9-42B Package

APPLICATIONS

Smartphones & Tablets
Active Matrix OLED Displays

TYPICAL APPLICATION

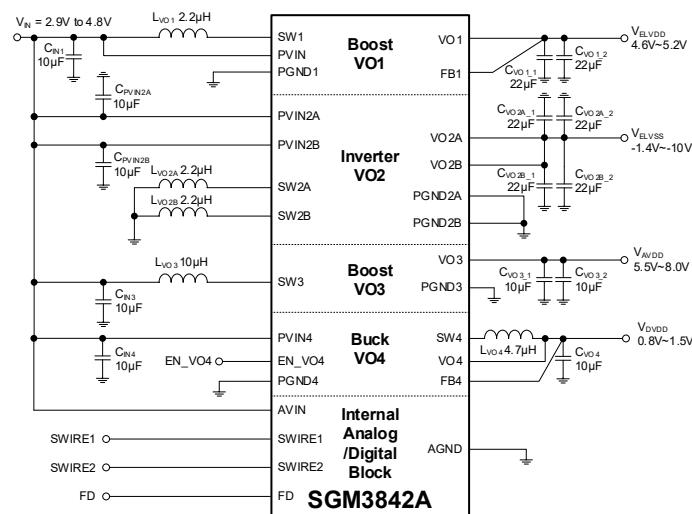

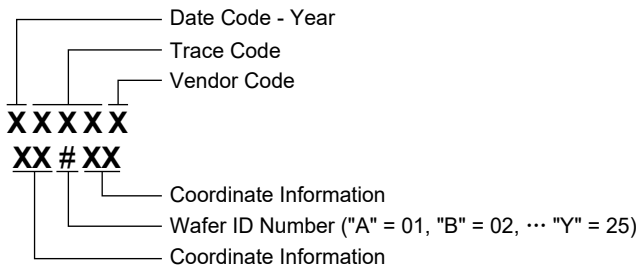

Figure 1. Typical Application Circuit

PACKAGE/ORDERING INFORMATION

MODEL	PACKAGE DESCRIPTION	SPECIFIED TEMPERATURE RANGE	ORDERING NUMBER	PACKAGE MARKING	PACKING OPTION
SGM3842A	WLCSP-2.5x2.9-42B	-40°C to +85°C	SGM3842AYG/TR	SGM 3842 XXXXX XX#XX	Tape and Reel, 5000

MARKING INFORMATION

NOTE: XXXXX = Date Code, Trace Code and Vendor Code. XX#XX = Coordinate Information and Wafer ID Number.

Green (RoHS & HSF): SG Micro Corp defines "Green" to mean Pb-Free (RoHS compatible) and free of halogen substances. If you have additional comments or questions, please contact your SGMICRO representative directly.

ABSOLUTE MAXIMUM RATINGS

Voltage Range (with Respect to Ground Pin)
 AVIN, PVIN, PVIN2A, PVIN2B, PVIN4, EN_VO4, SWIRE1, SWIRE2, FD, VO1, VO4, FB1, FB4 Voltages -0.3V to 6V
 SW1, SW4 Voltage -0.3V to 6V
 SW1, SW4 Voltage (Transient: 10ns) -1V to 8V
 SW3, VO3 Voltages -0.3V to 10V
 SW3 Voltage (Transient: 10ns) -1V to 12V
 VO2A, VO2B Voltages -12V to 0.3V
 SW2A, SW2B Voltages -12V to 6V
 SW2A, SW2B Voltage (Transient: 10ns) -14V to 8V
 Package Thermal Resistance
 WLCSP-2.5x2.9-42B, θ_{JA} 28°C/W
 Junction Temperature +150°C
 Storage Temperature Range -65°C to +150°C
 Lead Temperature (Soldering, 10s) +260°C
 ESD Susceptibility
 HBM 2000V
 CDM 1000V

RECOMMENDED OPERATING CONDITIONS

Operating Ambient Temperature Range -40°C to +85°C
 Operating Junction Temperature Range -40°C to +125°C

OVERSTRESS CAUTION

Stresses beyond those listed in Absolute Maximum Ratings may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect reliability. Functional operation of the device at any conditions beyond those indicated in the Recommended Operating Conditions section is not implied.

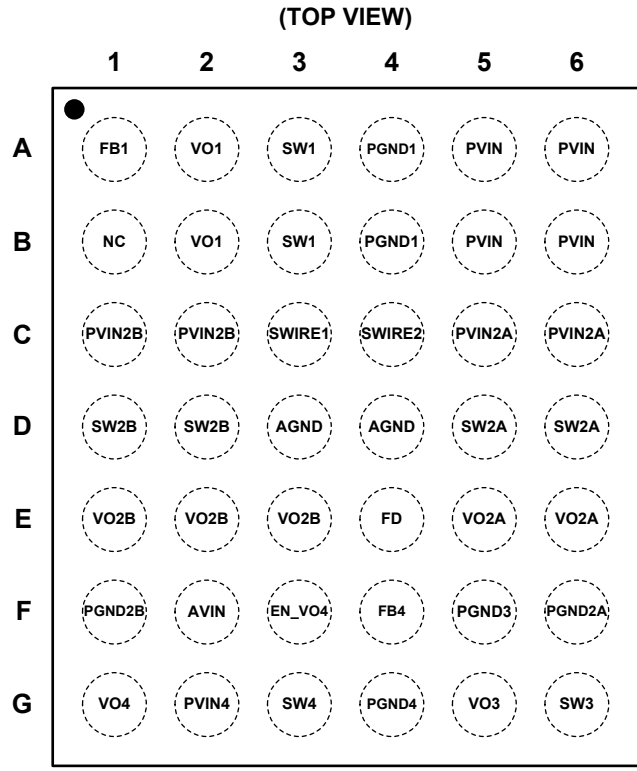

ESD SENSITIVITY CAUTION

This integrated circuit can be damaged if ESD protections are not considered carefully. SGMICRO recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage. ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because even small parametric changes could cause the device not to meet the published specifications.

DISCLAIMER

SG Micro Corp reserves the right to make any change in circuit design, or specifications without prior notice.

PIN CONFIGURATION

WLCSP-2.5×2.9-42B

PIN DESCRIPTION

PIN	NAME	TYPE	FUNCTION
A1	FB1	I	VO1 Boost Converter Output Sense Input.
A2, B2	VO1	P	VO1 Boost Converter Output.
A3, B3	SW1	P	VO1 Boost Converter Switching Node.
A4, B4	PGND1	G	VO1 Boost Converter Power Ground.
A5, A6 B5, B6	PVIN	P	Power Supply Input Pin.
B1	NC	—	No Connection.
C1, C2	PVIN2B	P	VO2 Inverting Buck-Boost Converter Phase B Power Supply Input Pin.
C3	SWIRE1	I	VO1/VO2 Converter Enable and Voltage Programming Pin.
C4	SWIRE2	I	VO3 Converter Enable and VO3/VO4 Voltage Programming Pin.
C5, C6	PVIN2A	P	VO2 Inverting Buck-Boost Converter Phase A Power Supply Input Pin.
D1, D2	SW2B	P	VO2 Inverting Buck-Boost Converter Phase B Switching Node.
D3, D4	AGND	G	Analog Ground Pin.

PIN DESCRIPTION (continued)

PIN	NAME	TYPE	FUNCTION
D5, D6	SW2A	P	VO2 Inverting Buck-Boost Converter Phase A Switching Node.
E1, E2, E3	VO2B	P	VO2 Inverting Buck-Boost Converter Phase B Output Pin.
E4	FD	I	Fast Discharge Enable Pin. FD = High: Enable Fast Discharge for VO1, VO2, VO3, and VO4. FD = Low: Disable Fast Discharge for VO1, VO2, VO3, and VO4.
E5, E6	VO2A	P	VO2 Inverting Buck-Boost Converter Phase A Output Pin.
F1	PGND2B	G	VO2 Inverting Buck-Boost Converter Phase B Power Ground Pin.
F2	AVIN	P	Analog Input Pin.
F3	EN_VO4	I	VO4 Buck Converter Enable Pin.
F4	FB4	I	VO4 Buck Converter Output Sense Input.
F5	PGND3	G	VO3 Boost Converter Power Ground Pin.
G4	PGND4	G	VO4 Buck Converter Power Ground Pin.
F6	PGND2A	G	VO2 Inverting Buck-Boost Converter Phase A Power Ground Pin.
G1	VO4	P	VO4 Buck Converter Output.
G2	PVIN4	P	VO4 Buck Converter Power Supply Input Pin.
G3	SW4	P	VO4 Buck Converter Switching Node.
G5	VO3	P	VO3 Boost Converter Output.
G6	SW3	P	VO3 Boost Converter Switching Node.

NOTE: I = input, P = power, G = ground.

ELECTRICAL CHARACTERISTICS

(At $T_J = +25^\circ\text{C}$, $V_{IN} = 3.7\text{V}$, $V_{\text{SWIRE}1} = V_{\text{SWIRE}2} = V_{\text{EN_VO}4} = V_{IN}$, $V_{\text{VO}1} = 4.6\text{V}$, $V_{\text{VO}2} = -5\text{V}$, $V_{\text{VO}3} = 7\text{V}$, $V_{\text{VO}4} = 1.2\text{V}$, unless otherwise noted.)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
Supply Current and Thermal Protection						
Input Voltage Range	V_{IN}	$T_J = -40^\circ\text{C}$ to $+85^\circ\text{C}$	2.9		4.8	V
Shutdown Current into PVIN, AVIN	I_{SD}	$V_{\text{SWIRE}1} = V_{\text{SWIRE}2} = V_{\text{EN_VO}4} = \text{GND}$		0.6	1.0	μA
Quiescent Current into PVIN, AVIN	I_{QON}	$V_{IN} = 3.7\text{V}$, no load, $V_{\text{SWIRE}1} = V_{\text{SWIRE}2} = V_{\text{EN_VO}4} = \text{high}$		6.2		mA
Under-Voltage Lockout Threshold (AVIN)	V_{IT-}	V_{IN} falling	2.13	2.27	2.35	V

DETAILED DESCRIPTION

Under-Voltage Lockout (UVLO)

The built-in under-voltage lockout function (UVLO) monitors the input voltage and disables the device when the input voltage is too low to operate.

Thermal Shutdown (TSD)

The device has a function of thermal shutdown, which prevents the device from damage due to overheating and excessive power dissipation. The device stops switching and shuts down all the outputs when the junction temperature exceeds +145°C (TYP), and restarts with the same programmed voltages and sequences when the temperature decreases to +135°C (TYP).

Boost Converter VO1 (ELVDD)

The Boost converter VO1 operates with a valley-current-mode topology and fixed 1.3MHz (TYP) frequency. The VO1 output voltage can be programmed between 4.6V and 5.2V (default 4.6V) with 100mV steps (see Table 2).

The output sense pin (FB1) is always connected to the positive pin of output capacitor for the highest output voltage accuracy. The wide hysteresis voltage makes the device suitable for large path loss applications. Additionally, the Boost converter can sense the output voltage with the VO1 pin, when the FB1 pin is floating or connected to ground or connected as close to the VO1 pin as possible.

The output of VO1 is fully isolated in shutdown mode.

Inverting Buck-Boost Converter VO2 (ELVSS)

The inverting Buck-Boost converter VO2 operates with a peak-current-mode topology and dual-phase fixed 1.2MHz (TYP) frequency. The VO2 output voltage can be programmed between -10V and -1.4V (default -5.0V) with 100mV steps (see Table 2).

When the load current exceeds 240mA, both phase A and phase B of the inverting Buck-Boost converter work. And only phase A works when the load current decreases to 160mA for reducing the switching loss.

The output of VO2 is fully isolated in shutdown mode.

Boost Converter VO3 (AVDD)

The Boost converter VO3 operates with a peak-current-mode topology and fixed 1.3MHz (TYP) frequency. The VO3 output voltage can be programmed between 5.5V and 8.0V (default 7.0V) with 100mV steps (see Table 2).

The output of VO3 is fully isolated in shutdown mode.

Buck Converter VO4 (DVDD)

The Buck converter VO4 operates with a peak-current-mode topology and fixed 1.3MHz (TYP) frequency. The VO4 output voltage can be programmed between 0.8V and 1.5V (default 1.2V) with 25mV steps (see Table 2).

The output of VO4 is fully isolated in shutdown mode.

Output Current Capacity

The device operates with an input voltage range of 2.9V to 4.8V. However, due to different input voltage and different output voltage, the output current capacity is quite different. A lower input voltage or a higher output voltage leads to a lower output current capacity.

Input Power Supply

The input power supply voltage is recommended between 2.9V and 4.8V. To achieve full performance, a stable and noise-free input source is needed. Once the distance between input source and SGM3842A is a bit long, additional capacitors are suggested to place as close to the device as possible. Please refer to the typical application circuit for the suggested input capacitance.

SGMICRO has patented circuits to solve the spike problem of V_{ELVDD} due to mode switching when the input voltage rises close to or higher than the programmed V_{ELVDD} .

Digital Interface (SWIRE1 & SWIRE2 Pins)

The positive output voltages V_{ELVDD} , V_{AVDD} , V_{DVDD} and the negative output voltage V_{ELVSS} can be programmed by the SWIRE1 and SWIRE2 digital interfaces with 100mV steps.

Figure 2 shows an example for SGM3842A programming V_{ELVSS} from -5.0V to -4.0V. The SWIRE1 and SWIRE2 pins can be used as standard enable pins for VO1, VO2 and VO3 if programming is not required.

DETAILED DESCRIPTION (continued)

The VO4 voltage can be preset by SWIRE2 and then it outputs when EN_VO4 is pulled high. In addition, the output voltage can be programmed when the EN_VO4 is already active.

The device starts with its default values (green marked

values in Table 2) if enabled. The SWIRE interfaces count the rising edges to set the corresponding values as shown in Table 2. The device utilizes a volatile memory to store the settings.

DETAILED DESCRIPTION (continued)

Soft-Start, Discharge, Start-Up and Timing Shutdown

The built-in soft-start function is adopted to limit the inrush current.

The output discharge function can be controlled by FD pin and SWIRE1/2 interface. See Table 3 to Table 5 for more details.

Toggling SWIRE1 high or with relevant pulses enables the VO1 Boost converter. VO1 starts with a 0.35A soft-start current limit until it rises to the programmed voltage. Then the full current limit is active (2.45A, TYP).

6ms after toggling SWIRE high, the VO2 converter starts switching phase A (VO2A) with a 0.7A current limit until the VO2 rises to the default voltage (-5V). Then the full current limit is active (3.1A per phase, TYP).

Toggling SWIRE2 high starts the VO3 Boost converter. Before VO3 rises to the default value (7.0V), it rises linearly for 1.8ms with a 0.35A current limit. Then the full current limit is active (1.05A, TYP).

Toggling EN_VO4 high starts the VO4 Buck converter. Before VO4 rises to the default value (1.2V), it rises linearly for 1.2ms with a 0.35A current limit. Then the full current limit is active (1.05A, TYP).

Table 3. VO2 Operation Mode Control

63	VO3: Fast
64	VO3: Hi-Z

Short Circuit and Overload Protection

The built-in short circuit protection (SCP) prevents the device from damage. If any of the four outputs (VO1, VO2, VO3 and VO4) is shorted to the ground or VO1 and VO2 are shorted together, the SGM3842A will trigger the function.

When a short or an overload occurs, all the four converters stop switching, the outputs are shut down and latched.

Only resetting the power supply or pulling SWIRE1, SWIRE2 and EN_VO4 low simultaneously for more than t_{OFF} can restart the device.

A SCP or overload occurs if any of the following events happens:

- V_{ELVDD} is not in regulation 2.76ms after V_{ELVDD} is enabled (SWIRE = high for longer than 2.76ms) then all converters shut down.
- V_{ELVSS} is not in regulation 7.48ms after V_{ELVSS} is enabled (SWIRE = high for longer than 13.5ms) then all converters shut down.
- V_{AVDD} protection is enabled when the soft-start is completed.
- V_{DVDD} protection is enabled when the soft-start is completed.
- V_{ELVDD} falls below 76% of the programmed output voltage longer than 1.2ms then all converters shut down.
- V_{ELVSS} rises above 71% of the programmed output voltage longer than 1.2ms then all converters shut down.
- V_{AVDD} falls below 87% of the programmed output voltage longer than 1.2ms then all converters shut down.
- V_{DVDD} falls below 82% of the programmed output voltage longer than 1.2ms then all converters shut down.

DETAILED DESCRIPTION (continued)**Device Reset**

- Power resetting resets the device to default settings.
- Short circuit and overload protection reset all settings.
- Pulling SWIRE1 high to enable the V_{ELVDD} converter resets the output discharge. Then output discharge is controlled by FD pin.
- Pulling SWIRE1 low for t_{OFF} resets the leakage current protection function.
- Pulling SWIRE1 and SWIRE2 low for t_{OFF} then V_{ELVDD} , V_{ELVSS} and V_{AVDD} are reset to default values of 4.6V, -5.0V and 7.0V, respectively.
- Pulling SWIRE2 and EN_VO4 low at the same time for t_{OFF} then V_{DVDD} is reset to default value of 1.2V.
- Pulling SWIRE1, SWIRE2 and EN_VO4 low at the same time for t_{OFF} resets the SCP or overloading latch-up.

Layout Guideline

AMOLED displays are sensitive to the quality of power supplies. A good PCB layout is quite important to

reduce the ripple and to enhance the line and load transients, as well as to achieve better noise, better EMI and loop stability. The recommended layout is illustrated in Figure 7.

It is recommended to follow the below PCB layout guidelines:

- A common ground plane between AGND and PGNDx can minimize ground shifts.
- Traces of switching nodes (SW1, SW2A, SW2B, SW3 and SW4) should be short and wide.
- Place input and output capacitors as close as possible to the related pins.
- Use short and wide traces to connect the input and output capacitors to the related pins.
- A common ground plane is between the ground pins of input capacitors and output capacitors.
- If the power IC has an exposed pad, connect AGND and PGNDx with the exposed pad.

Figure 7. PCB Layout Reference

REVISION HISTORY

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Original (OCTOBER 2023) to REV.A	Page
Corrected test condition of VO4 load transient from I_{VO3} to I_{VO4}	15
Changed from product preview to production data.....	All
